ABOUT GISTDA

GISTDA (Geo-Informatics and Space Technology Development Agency) is a Thai space agency and space research organization that specializes in remote sensing and technology development satellites.

GISTDA offers services such as optical satellites, radar satellites, measurement devices, unmanned aerial vehicles (UAVs), and information & analytic.

THINGS I DID

Plan
Design Three-Tier Architecture Presentation, Application, DB

Data Preparation
From GISTDA open-data to PostgreSQL database

API Creation
Node.js, tested with Insomnia

GUI Design
Planned and designed in Figma

Frontend Development
React.js, Tailwind CSS, and more

Deployment
Deployed on GISTDA server with a reverse proxy

TECHNOLOGIES USED

Programming Languages
HTML, CSS, JS, SQL, Python

API Development
Node, N, (Insomnia)

Backend Development and Database Management
PostgreSQL, DG, (PostgreSQL/elephant)

Geospatial Analysis and Data Visualization
TURF, (globe), (deck.gl), Q

Operating System
Linux

Frontend Development
React, Tailwind, mapbox, MapLibre, MUI, AXIOS

**Design and Internationalization**
Figma, i18next

Repository and Version Control
GitHub, Git

DEVELOPMENT OVERVIEW

Background, Proposed Solution, and My Contribution

- Farmers in Thailand commonly burn crop residue after harvest instead of proper plowing in order to save cost and time, leading to problems like wildfires and air pollution.
- Satellites with advanced imaging capabilities, like infrared and multispectral imaging, help identify crop types, ages, and hotspots.
- This data enables the government to predict and prevent fires, making informed decisions for authorities and vulnerable communities.

Satellites take images at different wavelengths

My Tasks

Burning crop residue → AI/ML → Process → Prediction, Map, Analysis

How I Process Data to Make Prediction and Analysis

Data .shp .csv .xlsx → .wkb (Well-Known Binary) → Spatial Analysis → .wkt (Well-Known Text) → Map Layer (GeoJSON) → Many layers are overlayed to create a complex map → Display prediction, map and analysis

Development Methodology

AGILE

PLAN → DESIGN → LAUNCH
DESIGN → DEVELOP → TEST → REVIEW → DEPLOY
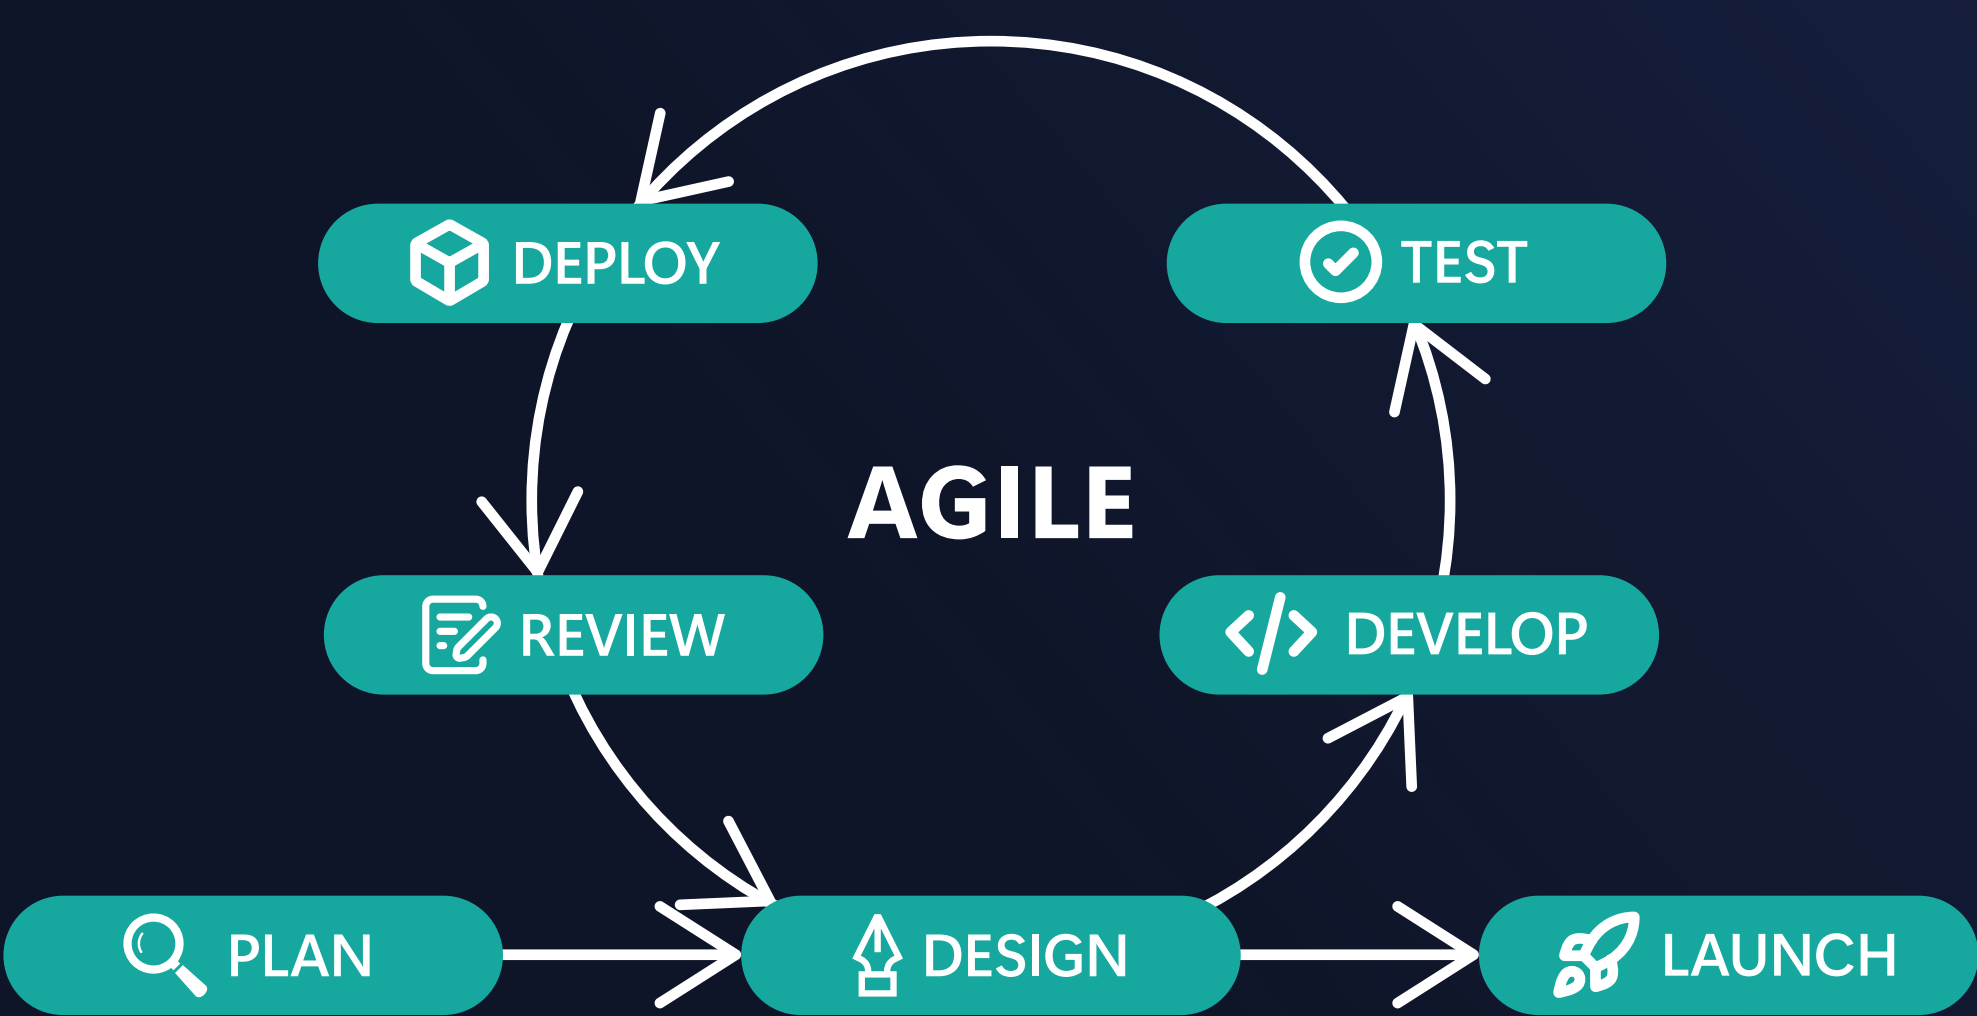

Agile is a flexible and iterative approach to software development. Instead of planning out every detail upfront, it breaks projects into smaller parts, known as "iterations" or "sprints."

Advantages of agile:

- **Flexibility:** Allows for changes and improvements throughout the project.
- **Customer-Centric:** Focuses on customer needs and feedback.
- **Faster Delivery:** Releases small, usable parts of the product quickly.
- **Improved Quality:** Continuous testing and reviews enhance product quality.
- **Cost-Efficiency:** Minimizes risks and reduces unexpected expenses.
- **Better Communication:** Encourages team collaboration and transparency.
- **Higher Satisfaction:** Clients and stakeholders see results sooner, boosting satisfaction.

ACHIEVEMENTS AND REFLECTIONS

Self Validation
This internship offers valuable insights into software developer positions and various other roles within the company.

Expanded Knowledges and Experiences
I have gained lots of experience in frontend development and learned a lot about APIs, backend development, and GIS.

New Techniques and Good Practices
My internship supervisor taught me new techniques and good practices for writing optimized and maintainable code.

Expanded Connections
I met many talented colleagues and experienced developers. We got in touch and shared each other's contact information and LinkedIn.
